In some cases, the model can also provide . GDL is used in a wide range of CAD applications from design planning to analysis to construction and may be used as a user interface to CAD. Thus, the GDL to Archicad conversions in this section were performed by creating new objects directly in Archicad and include all GDL parameters. ![Converting GDL text to Archicad.](figures/Archicad-GDLtext.png) When converting from GDL-Archicad to DXF, the objects created in Archicad are projected into DXF for building element dimensions. Dimensioned lines created directly in Archicad are mapped to Archicad dimensions and can be used as dimensions. Dimensions created in Archicad should match dimensions created directly in Archicad; otherwise, dimensions will not be properly mapped to Archicad. One potential drawback of Archicad-GDL is that some features of Archicad cannot be used in GDL objects. This is because the original GDL file does not contain any options to support or modify the model, whereas Archicad can be configured to perform these functions. When converting GDL-Archicad to DWG, the objects created in Archicad are projected into DWG and can be used for text generation in Archicad. The GDL-Archicad converter uses Blender for GDL-Archicad conversions. While many GDL-Blender converters exist [GDL-Blender: @GDL-Blender], this converter was selected for its high performance and customizable output. The GDL-Blender software is available for free download [GDL-Blender]. There are two main ways of converting GDL to Archicad: 1. GDL text - GDL text can be converted to Archicad directly through the GDL-Archicad converter. This is discussed in the next section. 2. GDL-Archicad objects - GDL-Archicad objects can be converted to Archicad directly. These GDL-Archicad objects can be used for building element dimensions and text generation in Archicad. These objects can also be used to build the Archicad model directly. GDL-Archicad: Converting Text to Archicad ----- 82157476af
